

## Ethylene filters

### Efficient protection with ethylene filters

Ethylene is a natural gas in vegetables and fruit, flowers and plants. It accelerates the ripening process. This means that vegetables and fruit, which are stored in a cold store, are in a large amount of ethylene gas and therefore ripen faster.

If you have experienced the damage ethylene gas can do to your load during transport you will understand why the former requires protection. Our efficient, innovative ethylene filters protect your products from ethylene during transport and storage.

### Oxylene

Oxylene is a strong ethylene filter consisting of two elements. The round shape creates a number of tangent planes through which the air can pass. This is essential for optimizing the effect of the Oxylene. The grain is a hard product which cannot be crumbled, ensuring that no grit can penetrate or mix with your products. The grain is purple in colour to start with. When the ethylene is absorbed by the grain, the grain becomes brown. The remaining product is black manganese, an environmentally friendly product.

- High absorption capacity
- Round grain
- Bag of 12.5 kg
- Powerful
- Environmentally friendly

Length	300 mm
Width	200 mm
Height	400 mm
Weight	12.500 grams
Productcode	1014
Composition of grain	AL203-Kmn05
Sales Unit	Bag 12,5 KG
