GRAPHITE BLACK

WENGE BROWN

COLOUR CHANGE

TEMPORARY

The wood flour in the composite slats contains lignin, sanding exposes the wood fibres to UV light and causes a **yellow-green colour change**. Drip edges and circles are also possible.

The lignin disappears on contact with rain.

After a few weeks, the slats will have returned to their original colour.

You can **speed up** this process by **regularly rinsing with water**.

Slats that have already started to discolour can be placed together with slats where this has not yet started.

Pay attention: Slats from **different production series** may show **slight differences in colour**.

OTHER LOOK

PERMANENT

The slats are brushed on 2 different machines, and thus receive a yellow or a white sticker.

The brushes are subject to wear, so the look may be slightly different.

So in 1 panel, always place slats with the same colour sticker in the same place (front/back and top/bottom), to get a nice even look.
