

Mineral make-up is a type of make-up that uses only powders derived from minerals and nothing else: mica, zinc oxide, titanium oxide and colored pigments; this type of make up is all made of powder and so it could highlight the imperfections of a dry or mature skin. This means that it is not a type of product suitable for everyone.

Mica, Titanium Dioxide, Zinc Oxide, Iron Oxides, Ultramarines, Kaolin Clay, Manganese Violet, Silica, Ferric Ferrocyanide, Chromium Oxides: these are the minerals that constitute the mineral makeup; many of these are also present in our products, but we combine them with moisturizing and emollient substances in order to make the mineral make-up much more comfortable and not having the feeling of skin pulling.

Another disadvantage of mineral makeup: being composed by only powders, it can be much more difficult to work and spread compared to traditional make up, and it also hasn't the same coverage and durability. Facial hairs are also highlighted, while a liquid foundation goes to "flatten" them and hide them.

We are manufacturers of make-up for professional use and we want an impeccable performance and the mineral make-up cannot offer it.

Here below you can find a list of our products containing minerals:

<b>MINERAL</b>	<b>PRODUCT</b>
