somnibel · positional device

What is Somnibel?

Somnibel is a Class IIa medical device that **reduces the impact of positional sleep apnea and/or snoring.**

It consists of a small, light device that is attached to the forehead and vibrates gently whenever your patient is sleeping in a supine position, encouraging him or her to change position and thus reducing the impact of respiratory events in sleep, such as positional apnea or snoring.

Many different clinical studies believe positional therapy to be an effective solution for positional OSA, obtaining similar results to CPAP treatment.

Somnibel has been developed by **SIBELMED** with the collaboration of the sleep units at the **Araba/Osakidetza University Hospital** (Vitoria, SPAIN) and the **Arnau de Vilanova University Hospital** (Lleida, SPAIN).

Obstructive sleep apnea (OSA) is a common disorder affecting at least 2% to 4% of the adult population.

Clinical Guideline for the Evaluation, Management and Long-term Care of OSA in Adults, the AASM.
Lawrence J. Epstein and al.

An estimated 56% of patients with OSA are positional.

Oksenberg Chest 1997
Richard Eur Arch Otorhinolaryngol 2006

35% of the adult population snores, of whom 75 % of simple snorers are positional.

Easy

No adjustment required

Restorative sleep

Benefits

Somnibel is a great step forward in comfort for patients with positional OSA.

- It is comfortable, silent and painless.
- No adaptation period.
- Does not affect or fragment the sleep structure.
- Suitable for travel, because it is light, small and easy to carry.
- Hygienic and non-invasive.

Reduces apnea and snoring index

Increases blood oxygen saturation

Improves high blood pressure

Improves sleep quality and daytime sleepiness

Improves quality of life

Improves bed partner's rest

Positional Therapy
somnibel[®]

Use by patients

Somnibel is aimed at patients with OSA and/or positional snoring.

Among other functions, it is activated 15 minutes after lying down to sleep and detects the sitting position, waiting a few minutes before re-applying the stimulus so that the patient can fall asleep after having gotten up.

Positional Therapy
somnibelPro

Use by specialists

SomnibelPro is aimed at sleep units and prescribing centers.

It monitors, assesses the effectiveness and tracks the therapy.
Its configuration means that the signals can be recorded, viewed and analyzed using SomniLab software.

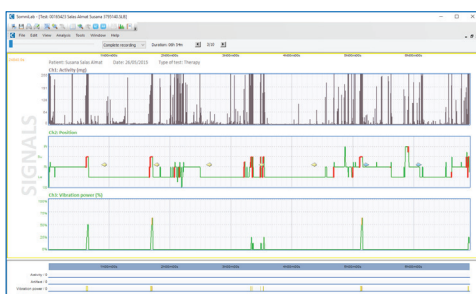

SomniLab Software

SomniLab is an intuitive software developed to download and analyze the signals recorded by your **SomnibelPro** device.

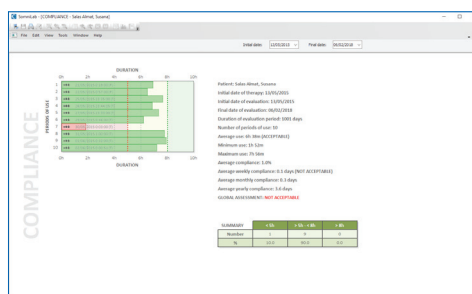

It is used to save and view:

- Body position
- Actigraphy
- Stimulus intensity

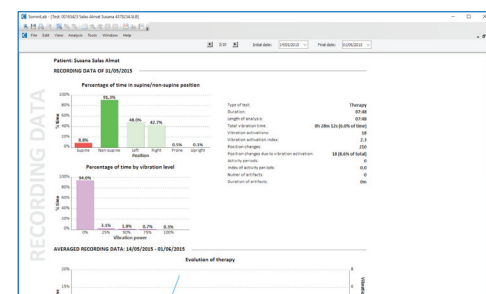

SomniLab will allow you to easily validate and track your patients thanks to its analysis of positional treatment compliance. You can use it to configure **SomnibelPro** and adapt it to each of your patients' needs. It also offers personalization options, such as initial delay times for sleep, vibration delay in supine position or increased vibration, as well as modification of therapy or placebo mode for possible clinical studies.

Product developed by **SIBELMED** in collaboration with

Screen&Go

1 to 8-channel screening polygraph*

- Respiratory flow
- SpO₂
- Pulse (BPM)
- Snoring
- Thoracic effort
- **Position**

* Activity and Thermocouple (optional)
* Thermocouple cannot be used at the same time as the thoracic effort

Sleep&Go

8 to 16-channel cardiorespiratory polygraph*

- Respiratory flow
- SpO₂
- Pulse (BPM)
- Snoring
- Thoracic effort
- **Position**
- Activity
- Abdominal effort
- Thermocouple
- Bluetooth
- CPAP level
- Limb movement
- Pulse wave

* External EXG module for EEG, EMG, EOG, ECG tests (optional)
* External snoring cannot be used at the same time as the movement sensor
