

Start with the 1/N/R/A/M selector panel.

Pop out window/side mirror switch panel from underside from now removed selector panel. Disconnect harness.

Locate the 4 10mm mounting posts with nuts. Carefully lift up that console piece and turn over to be able to access and disengage the Hazard and DNA selector harnesses. There is a guide pin at the rear of that console piece that seats and aligns that front piece with the rear piece.

Undo and detach ebrake boot

Once you have removed the center console, you have to attach 2 brackets from OEM part as seen in picture

After that, you can start putting electronic parts to the sockets. You can rather choose to glue it with silicon, or some adhesive which you preffer.

And make the reverse process from beginning.
