

Maintenance Guide

Congratulations on the purchase of your Tankkd stock tank.

Stock tanks are very easy to maintain and can last for years if you take care of them.

1. Delivery of your Tankkd

Stock tanks come from distant Nebraska, so they can still be a little dirty.

Take a mild baby shampoo with a soft sponge and lather the tank well, then rinse well with water.

If black spots (grease) are visible, you can brush them with a white melanin sponge. You can buy it from us but also at the supermarket.

The melanin sponge is good for dirt but also for lime on the tank.

You can well rub the tank with a mild oil every year. So even if you washed it. Rub it with a microfiber cloth.

2. Installation

You can find all manuals online on our online store. If you have any questions, feel free to contact us via Whatsapp

Some tips:

Check that the pump is

Turn on the TANKKD taps

You wash the filter medium every two weeks at 30 degrees in a laundry bag without product. Then let it dry naturally and certainly not in the dryer.

Do not leave the stove on until you are sure of traffic.

3. Fill your Tankkd

The time has finally come!! But how to keep the water tidy?

If you have a small tankkd, you will probably change the water enough when it gets dirty. For example for ice baths.

If you have a larger Tankkd, FILTERING is the most important thing. In summer from 8 a.m. to 12 p.m., in winter from 4 a.m. to 6 p.m.

Chemicals always have a negative impact on the lifespan of your Tankkd, which is why we will use as few as possible. It's healthier for you, but also for the Tankkd

WITHOUT filters, we will never use chemicals.

Here you will always test the water quality first. Then you will see that depending on the rain or tap water, the pH is too high or too low. As a result, the alkalinity is also too high or too low.

In the included booklet, you can see the steps well.

With tap water, you will see that the pH is too low, the alkalinity too high and copper probably too.

In this case, you will control the pH.

We're not going to add products if we don't need them. Test weekly and add necessary.

Use the right quantities and always when the filter is running. Always dissolve the products in a cup with warm water before putting them in the tank.

place a slow chlorine tablet in a float. (THE SMALLEST VERSION = as large as a coin of 2 euros maximum) 1 tablet every 2 weeks.

4. The fabric cover is a summer cover that can fly away in strong winds. Here you can optionally use magnets to hold it in place.

5. WINTER

If you have a heater, you'll probably use the Tankkd for as long as possible. If it freezes, you can heat up every day so that the pipes cannot freeze or you can turn off the pump and heating and let out all the water. Store the pump in a dry place. Make sure all the water is out of the stove. Wash the tankkd as you did at the beginning with a mild shampoo and make sure it is dry inside (turn it over or cover it). You can also leave the water in the tank, without the pump and heater, and freeze it. For this, no chemicals must have been used a month before.

If you only use the tank in summer, leave the water with the filter on for 4 hours a day without chemicals. When it freezes, log out and make the choice described above.

So we never let an unfiltered tank hibernate with water containing chlorine or chemicals.

Place your winter cover on the tank (thermocover)

6. **Before use, always read the safety instructions and manuals that you can read on our website.**
