sense **and** simplicity

Introduction

As a leader in the development, manufacturing, and supply of sleep diagnostic sensors, we offer a full line of high-performance, quality Pro-Tech sensors to help you maintain low cost of ownership while obtaining the data you need. Our sensor product line includes durable and reliable sensors that detect respiratory airflow, respiratory effort, snoring, periodic limb movements, and sleep position.

We are strongly committed to research and development in order to provide products that create a better experience for clinicians and their patients.

Our sensors also meet important AASM accreditation standards. The AASM scoring rules have guidelines regarding the use of certain types of sensors in order for sleep labs to meet accreditation standards. We have included an appendix on page 19 that will assist you in the selection of our products that meet the AASM scoring guidelines.

To see which sensors are compatible with your system refer to the table in the back of this booklet or visit our online product selector at www.pro-tech.com.

Understanding RIP signals vs. piezo signals

RIP	Piezo
Directly reflects breathing activity of a patient	Indirectly reflects breathing activity of a patient
Sensor wire wraps around the patient	Sensor (piezo) most commonly located near the belt buckle
Belt only needs to be snug on the patient for an accurate signal	Belt needs to be pulled taut for an accurate signal
Gain settings do not change during the night when the signal decreases	Gain settings usually need to be altered during the night to capture the signal
The signal decreasing reflects true patient breathing effort	The signal decreasing, or changing, can reflect "trapping" or artificial artifact
Thoracic belt placement is designed to be more precise than piezo	Belt placement can be anywhere in the thoracic area and pulled tight
